Table of Contents

- Introduction
- Background
- Design
- Evaluation
- Conclusion
Introduction

- Why we need hardware-based TEEs?
- TEEs are programmable (TPMs/HSMs)
- Application developers have lacked the interfaces to use hardware-based TEE functionality
- Software development kits are proprietary or expensive
Introduction

- Why we need hardware-based TEEs?
- TEEs are programmable (TPMs/HSMs)
- Application developers have lacked the interfaces to use hardware-based TEE functionality
- Software development kits are proprietary or expensive
- Open-tee
  1. Not intended to emulate a hardware TEE
  2. Compile and run Trusted Application successfully on any TEE-compliant targets
Background - Structure

- Rich Execution Environment (REE)
- Trusted Execution Environment (TEE)
- Trusted Application (TA)
- Client Application (CA)
TEE architectural options

- Co-Processor
  - External Security co-processor: outside of main System on Chip (SoC)
  - Embedded Security co-processor: embedded into the main SoC
TEE architectural options

- Co-Processor
  - External Security co-processor: outside of main System on Chip (SoC)
  - Embedded Security co-processor: embedded into the main SoC
- Processor Secure Environment
TEE architectural options

- Processor Secure Environment
  - ARM TrustZone
  - Intel Software Guard Extensions (SGX)
Why Open-TEE?

1. Enable to utilize TEE functionality
2. Provide a fast and efficient prototyping environment
3. Promote research into TEE Services
4. Promote community involvement
Architecture of Open-TEE

1. REE Client API and TEE Core API

2. Requirements
   2.1 Compliance and ease-of-use
   2.2 Hardware-independence
   2.3 Reasonable Performance
Architecture of Open-TEE

```
Base
    [fork()]

Manager

Launcher
    [clone()]

CA

TA
```
Architecture of Open-TEE - Base

1. A process that encapsulates the TEE functionality as a whole
2. Loading the configuration
3. Preparing the common parts of the system
4. Forking two processes: Manager and Launcher
1. Open-TEE’s operating system

2. Manager’s responsibilities:
   2.1 Managing connections between applications
   2.2 Monitoring TA state
   2.3 Providing secure storage for a TA
   2.4 Controlling shared memory regions for the connected application
Architecture of Open-TEE - Launcher

1. Creating new TA processes
2. Loading TEE Core API library
3. Waiting commands from Manager
Architecture of Open-TEE - TA Processes

1. Each process is divided into two threads
2. Inter-process Communication (IPC) thread
3. TA logic thread
Evaluation

1. Hardware-independence
2. Performance
   2.1 Disk and Memory consumption
   2.2 Build and Run performance
3. Ease to use
